

How to remove urine and urine odours from synthetic grass.

To remove urine odours & stains **permanently** you need to use **urineFREE®**.

Synthetic grass is usually built on a rock and sand base with small holes in the material to allow for drainage. When the synthetic grass has been urinated on, it is very likely that the urine run-off has seeped through the grass, into the rock and sand and will remain there.

When urine dries it crystallises and it is these uric acid crystals that are difficult to remove. Conventional cleaners and just water **will not** break down the uric acid crystals and they will remain as will the odour. Only a bio-enzymatic formulation found in **urineFREE** will remove uric acid crystals for good.

urineFREE's bio-enzymatic action is designed to "eat" these crystals along with the urea and urochrome components of urine and eliminate the urine smell for good.

How BackyardFRESH™ can help - a cost effective combination.

When it comes to treating urine odours in your backyard it is not always necessary to make sure the urine deposit is removed each time because many pets will frequently visit your garden beds, synthetic grass or their favourite spot. Permanently removing urine deposits on these areas on a continuous basis could be a costly exercise!

BackyardFRESH™ is a great, cost effective alternative to **urineFREE** when treating urine odours on fake grass.

BackyardFRESH is a high performance, safe odour control solution for pet and outside odours. This unique ready to use formula will give you relief not only of urine odours but other pet & outside odours at a great price.

We recommend that **BackyardFRESH** be used in conjunction with **urineFREE** in between **urineFREE** treatments for affordable long term relief from urine odours & urine deposit in your synthetic grass.

How much urineFREE do I need to eliminate the urine in my synthetic grass?

The amount of **urineFREE** you are going to need depends on the amount of urine that has been deposited and the porosity of your synthetic lawn. For example one dog (depending on size) can urinate between 200-2000ml each day. Over 365 days this is a large accumulation of urine. Therefore we cannot recommend an exact quantity as every case is different. The more urine you have the more **urineFREE** you will need to eliminate the urine for good. We offer 5 & 10 Litres for larger deposits but in some cases more may be required.

If your pet is going to revisit this lawn then complete removal is costly but regular maintenance to remove some of the urine using **urineFREE** will help reduce the long term odours.

BackyardFRESH can be used to provide temporary relief in between **urineFREE** treatments.

Please note: The Synthetic Grass Package we suggest is only a guide. In some cases it will be sufficient to solve the problem, in other cases it may not be enough. If the lawn has been urinated on over a long period of time more **urineFREE** may be necessary to complete the job.

Directions on how to apply urineFREE to synthetic grass:

It is important that you **saturate** the grass so that **urineFREE** penetrates where the urine has seeped and makes contact to remove the underlying urine odour. **urineFREE** must come into contact with all the urine to be 100% effective.

Do not treat the lawn on hot days as it will cause **urineFREE** to dry too quickly reducing its effectiveness. The evening when the sun is down is best.

Do not treat the lawn during rain as it will dilute **urineFREE** and reduce its effectiveness.

Some customers use a plastic sheet to cover the synthetic lawn during treatments to keep **urineFREE** moist for as long as possible. When it is moist it is still working. One hour to overnight would be sufficient time.

After the first application, allow to air dry, then hose down the grass to remove the residue from the biological activity. It may take more than one application on old urine or for larger deposits. The sniff test will tell you when you've got it all. Once the odour is gone and if the grass is still being used by your pet then apply weekly for maintenance or as required.

Alternatively you can use **BackyardFRESH** to control urine odours in between **urineFREE** treatments to reduce your ongoing maintenance costs.

Directions for applying BackyardFRESH to synthetic grass:

Ready and easy to use, lightly spray **BackyardFRESH** onto or around the problem area for immediate results.

5 Litre **BackyardFRESH** can be used in conjunction with our battery sprayer or a garden pump sprayer.
